Technical Requirements

The DriverPass system will require hardware such as computers, tablets, or smartphones with reliable internet access so customers and employees can access the system. The software will include a web-based application connected to a centralized database to store customer accounts, driving packages, appointments, payments, driver notes, online classes, practice-test results, and activity logs. Modern web browsers should be supported.

The system will require infrastructure such as cloud-based or dedicated servers to host the application and database. Security requirements should include HTTPS/TLS encryption, user authentication, role-based access, firewalls, regular backups, and activity logging. These requirements will allow customers and employees to reliably access the system while protecting customer and business information.
